

PRESS RELEASE - 10 March 2016

AN ELECTRICAL INSPECTION AND TESTING INNOVATION

Cobweb IS Ltd is pleased to announce a new innovation in electrical compliance management.

Large buildings and estates need to adhere to statutory electrical regulations in order to meet their electrical compliance responsibilities- the management of electrical compliance is both challenging, time consuming and requires careful risk management. The current approach to managing electrical compliance wastes time and money and increases risk of non-compliance or worse an electrical shock or fire.

Smarter EI&T powered by EDIS V3.0 is a new innovation and best practice that reduces the cost, risk and time of electrical compliance management by automating the management of electrical data and the planning of electrical compliance.

Smarter EI&T integrates a process, governance and a system in order to more efficiently manage electrical compliance in line with the Electricity at Work Act and supporting regulations, including BS7671.

The recently release EDIS V3.0 enables the automation of the process for managing the large volume of electrical data required and provides management reports to ensure the process is followed- large estates or buildings can have over 500 distribution boards which result in 1,000's of pages of certification, schedules, schematics and other electrical documents. EDIS manages these data, records and document challenges.

Smarter EI&T allows the data to be efficiently captured "one time" - after which all certification, schedules, distribution networks, risk reports and future planning documentation to be automatically generated. This process saves time and money for managers, electricians and supervisors and improves the risk management. The alternative is a collection of disparate documents which are manually manipulated and unknown or difficult to monitor risks.
